[ABSTRACT]

A silver halide photographic processing solution comprising at
5 least one polymeric compound inhibiting sludge formation and
preventing "pi-line" artefact, more particularly in radiographic
non-destructive testing applications, wherein said polymeric
compound comprises at least one monomer unit having a silver
complexing moiety and at least one monomer unit having a
10 solubilizing group, and wherein both said silver ion complexing
moiety and said solubilizing group are comprised in same or
different monomer units.
